

## Electronics designers offer state-of-the-art manufacturing facilities through new partnership

UK electronics and software design engineers CircuitWorx have joined forces with established French manufacturing specialists Selva. The new partnership offers clients an integrated design and volume manufacture service, easing the often difficult transition from research and development into high quality market-ready products.

Manufacturing and testing facilities available include placing fine pitch and complex surface mount components, in situ bed-of-nails and flying lead tests, Automated Optical Inspections, and X-ray Inspections.

Announcing the collaboration, CircuitWorx director and embedded software expert Carl Matthews explained: "Start-ups in particular can struggle to transform their initial ideas and R&D prototypes into professionally manufactured products. With this partnership we are not only able to assist our clients with electronics and software design but also now offer state-of-the-art manufacturing and testing techniques, helping alleviate production hiccups that might thwart a product launch at the last-minute."

CircuitWorx co-founder and hardware expert Rob Steel added: "We're really impressed with Selva's commitment to quality and the expertise they offer. This partnership presents new opportunities for anyone wishing to design and manufacture world-leading electronics products without the hassle of managing several subcontractors throughout the process."
