

Local design firm goes from strength to strength

Romsey-based electronics and software engineering consultants CircuitWorx have announced further expansion in their business via a renewed partnership with French manufacturing specialist Selva Electronique. This exciting development will improve the services CircuitWorx offers to clients as well as bringing further economic success to the region.

The international affiliation, now in its second year, has seen the two businesses partner on a number of projects to design and manufacture bespoke electronic products for clients. Now a French government scheme is helping the UK company to further expand its skill set and grow its business. Through the International Internship Program (VIE), one of Selva's graduate engineers will be placed with CircuitWorx for the next 12 months. As well as providing an international presence for Selva this professional assignment will enable CircuitWorx to offer more resources, better manufacturing and technical expertise, and a faster project throughput to their clients.

CircuitWorx co-founder and embedded software expert Carl Matthews commented: "We are delighted to welcome our newest engineer Baptiste to the team. This continued partnership with Selva is a really exciting opportunity for us to grow our business, and we are looking forward to expanding further in the coming months."

CircuitWorx is continuing to grow both the manufacturing and design sides of its business to keep up with customer demand, working in tandem with other local suppliers and design agencies where possible. The company's excellence in innovation, technology and business performance has been recognised both regionally and nationally, with the firm recently being shortlisted as a Finalist for the Test Valley Business Awards and for two British Engineering Excellence Awards.
